#### Overview

Rotational moulding (often referred to as Rotamoulding or Rotomoulding) is a process used for producing hollow plastic products. By using additional post-moulding operations, complex components can be produced enabling the process to compete effectively with other moulding and extrusion practices.

Rotational moulding differs from other processing methods in that the heating, melting, shaping, and cooling stages all occur after the polymer is placed in the mould, therefore no external pressure is applied during forming.

This provides the following advantages:

- Economically produced large products
- Minimum design constraints
- Stress-free products
- No polymer weld lines
- Comparatively low mould costs

PRODUCTS](#)

#### The Process

The Rotational Moulding process is essentially split into four operations:

##### Charging Mould

A pre-determined amount of polymer powder is placed in the mould. With the powder loaded, the mould is closed, locked and loaded into the oven. The powder can be pre-compounded to the desired colour.

##### Heating & Fusion

Once inside the oven, the mould is rotated around two axis, tumbling the powder – the process is not a centrifugal one. The speed of rotation is relatively slow, less than 20 rev/min. The ovens are heated by convection, conduction and, in some cases, radiation. As the mould becomes hotter the powder begins to melt and stick to the inner walls of the mould. As the powder melts, it gradually builds up an even coating over the entire surface.

### Cooling

When the melt has been consolidated to the desired level, the mould is cooled either by air, water or a combination of both. The polymer solidifies to the desired shape.

### Unloading/Demoulding

When the polymer has cooled sufficiently to retain its shape and be easily handled, the mould is opened and the product removed. At this point powder can once again be placed in the mould and the cycle repeated.

### Typical Materials Used

Polyethylene (Low Density)  
**LDPE, LLDPE**

Polypropylene  
**PP**

Ethylene Vinyl Acetate  
**EVA**

Polyvinyl Chloride  
**PVC**

### Typical Products Produced

Manhole inspection chambers  
Rainwater tanks  
Slides and climbing frames  
Diesel fuel tanks  
Childrens playhouses  
Traffic cones  
Canoes and kayaks  
Pallets

#### Contact A Rotational Moulder

Complete the form below if you are looking for a rotational moulded product. The British Plastics Federation will, on your behalf send this to the leading rotational moulders who will contact you if they can supply the product

We are grateful to the Rotomoulder Balmoral for their assistance in compiling this page.
